Product Manager

SUMMARY

4+ years of Southeast Asia cross-border e-commerce product experience, specializing in reverse logistics & refund strategies, merchant order management, and store industry solutions. Data-driven, built AI applications from 0 to 1 (intelligent refund adjudication, smart compensation, fulfillment negotiation). Experienced in cross-functional collaboration across logistics, customer service, risk control, and merchant operations. Fluent in Chinese and English.

PROFESSIONAL EXPERIENCE

Alibaba — AIDC — Reverse Transactions & Compensation-Senior Product Manager Dec 2023 - Sep 2026

1. Responsibilities: As the Product Owner of after-sales services (cancellation refunds / return-and-refund / refund-only / after-sales compensation), I used multi-dimensional data insights and research as the basis for decisions, systematically decomposed after-sales issues around consumer experience, merchant experience, and platform cost, built AI after-sales applications from 0 to 1, and collaborated with logistics, customer service, platform policy governance, risk control, and other teams to optimize the after-sales chain.
2. Key results: In the cancellation scenario, retained 2.1% of platform GMV on an annualized basis while maintaining the buyer/seller cancellation experience. In the return-and-refund scenario, increased consumer satisfaction by 3% and reduced total after-sales cost by 29% annually. In the compensation scenario, increased consumer repurchase rate by 5% and improved compensation-service ROI by 50%.
3. Key projects

- AI Smart Refund & Liability Determination
  - [Refund & liability process governance]: Conducted a comprehensive review and credibility assessment of the existing reverse-audit SOP on the customer-service side, identified governance gaps such as ambiguous processes/standards and execution deviations, and through standardization and structural transformation established a clearly-bounded, quantifiable reverse-audit rule system that laid the rule foundation for subsequent automation and intelligence upgrades.
  - [AI refund & liability determination build]: Reused the adjusted customer-service audit logic, layered on risk-control strategy models, and built a reverse AI refund-and-liability-determination robot from 0 to 1 to replace platform customer-service review. Covered core stages including guided intelligent form-filling for consumers, identification of refund intent and evidence, automated refund decisions, automated evidence submission, and funder determination.
  - [Key results]: Increased after-sales success rate by 9.5pt, shortened refund-only processing time by 40%, and raised consumer after-sales satisfaction by 3%. Also reduced total after-sales cost by 29% annually.
- AI Automated Compensation & Intelligent After-Sales Strategy
  - [AI compensation chain design]: Systematically rebuilt the after-sales compensation chain, constructed compensation factors based on multi-dimensional user and transaction data, replaced fixed rules with dynamic models, and produced differentiated compensation plans under budget and ROI constraints. Connected the end-to-end (C-side) compensation expression and customer-service-side tagging capabilities, iterated strategies through A/B testing, and achieved a leap from uniform compensation to stratified, precise compensation.
  - [Key results]: Increased the repurchase rate of consumers who received compensation/refund services by 5% and improved after-sales compensation/refund ROI by 50%.
- Lost Package — Refund-Only Process Redesign
  - [Process review & redesign]: To address the high share of refund-only cases caused by lost packages in Southeast Asia, poor consumer experience, and the lengthy, inefficient customer-service handling chain, redesigned the chain from consumer refund-application submission to platform review.
  - [Cross-team collaboration]: Worked with logistics and customer-service teams to shorten logistics response time to 48 hours and lock it into the tripartite contract, connected the three-end system spanning reverse, logistics, and customer service, and standardized logistics evidence requirements.
  - [Key result]: Increased the consumer package-found rate by 10pt, reduced CC customer-service refund-only tickets for lost-package scenarios by 85% on average per month, reduced 16 customer-service headcount (HC) annually, and lowered logistics-side fund loss in lost-package scenarios by 75%.
- Cancellation Strategy Governance & Cancellation Retention
  - [Product strategy]: To address the pain points of poor buyer/seller experience and GMV loss caused by forced order cancellation due to late fulfillment, as well as consumers' unnecessary cancellations, shifted the strategy toward "replacing cancellation with fines and returning the cancellation right to consumers." Based on cancellation reasons and order-retention factors, strengthened consumers' perception of existing benefits, services already enjoyed, and fulfillment timeliness, raising the cost of cancellation to retain convertible orders.
  - [Key results]: Retained 2.1% of platform GMV on an annualized basis while consumer satisfaction, consumer inbound inquiries, and merchant fulfillment performance remained stable.

Alibaba — AIDC — Merchant Order Management-Product Manager Dec 2023 - Mar 2025

1. Responsibilities & results: Independently owned merchant order management and fulfillment tools; on the merchant order management side, carried order, product, inventory, marketing, and industry information for buyers and sellers; built capabilities from 0 to 1 including unification of merchant order management across three ends (PC, mobile, and open API), mobile barcode scanning, and fulfillment-shipping negotiation. Increased merchant 24-hour shipment rate by 5pt and merchant satisfaction by 12%.
2. Key projects

- Three-End Unification (PC / Mobile / Open API) & Mobile Barcode Scanner
  - [Product strategy] Reviewed the historical logic and optimization opportunities of 10+ core order-management features, pages, and customizations, and applied the capabilities and customized interactions to the mobile end. Also built a new mobile barcode-scanning shipment capability tailored to the portability of mobile devices.
  - [Key results] Increased merchant 24-hour shipment rate by 5pt, reduced consumer inbound inquiries about merchant shipment status by 18%, and raised merchant order-management satisfaction by 12%.
- Fulfillment & Shipping Negotiation
  - [Product strategy] Used AI models to proactively identify force majeure and batch-waive shipment assessments, while opening a merchant reporting entry and fulfillment reminders to reduce order cancellations not caused by merchants. For merchants' occasional fulfillment difficulties, upgraded the shipping negotiation tool to support batch application submission, coupon/benefit configuration, and multi-entry outreach, replacing direct cancellation with negotiated retention.

- [Key results] Launched the project within 2 months and recovered, on an annualized basis, 0.21% of platform GMV lost due to merchant stock-outs and slow shipments.

Alibaba — AIDC — Store & Industry Solutions-Product Manager Apr 2022 - Nov 2023

1. Responsibilities & results: Owned store shopping guidance and merchant store decoration, and built the store ranking from 0 to 1; during my tenure, increased store DAU share by 1pt, consumer conversion rate by 2pt YoY, and store GMV share by 3.5pt. Independently handled industry requirements for Southeast Asian markets, and for the furniture category built the "Place in My Home" shopping-guidance feature, significantly improving consumer conversion on product detail pages and orders per buyer.

2. Key projects

- Store ranking construction: Built the store ranking using multi-dimensional store data (category, sales, follower growth rate, repurchase, etc.), and placed the ranking across PDP, store, and other private-domain touchpoints. Completed and launched the ranking within 3 months, covering 4.2% of merchants with ipv > 0, with consumer conversion on store-ranking traffic 2pt higher than overall store traffic.
- "Place in My Home" × Furniture Shopping Guidance: Provided merchants with the ability to upload and process transparent-background product images and associate them with on-shelf products, while placing the feature on product detail pages to let consumers place furniture into real photo scenes through an interactive gameplay, mix and match different furniture, and make more informed purchase decisions. Launched within 2 months, covering 30k+ online SKUs. A/B testing showed that product detail pages with the "Place in My Home" entry had 1.7pt higher consumer conversion and 43% higher orders per buyer.

EDUCATION

University of Glasgow-Computer Science Master Full-time Jan 2021 - Jan 2022

- Degree Level: Merit

Hunan University of Technology-Information Management and Information Systems Bachelor Full-time Sep 2016 - Jun 2020

- GPA: 3.83/4.00 (ranked 1st in major); received university scholarships, Outstanding Student Cadre, and Three-Good (Merit) Student honors for four consecutive years.

OTHER SKILLS

- **Product skills:** Requirements analysis, data analysis, SQL, A/B testing, Figma, project management, cross-team collaboration
- **AI skills:** Familiar with prompt engineering, skills design, AI workflow design, and building evaluation & tuning systems
- **Languages** IELTS 7.0, CET-4/CET-6; able to use English as a working language
- **Interests** Fitness & dancing, photography, video shooting & post-production
